

Applying RTV from Caulk tube

One part RTV applications are a snap with the RP robot and the optional piggy back caulk tube holder.

No more messy hand held dispensers that waste time and material. Just slip a standard caulk tube into the pressurized holder and everything becomes automatic!

An optional 2 position indexing fixture is available to streamline the load/unload operation and improve cycle time.

All this in a truly compact, space saving benchtop package!

Simple Operation, Simple Software

No programming experience required!

The dispense path may be taught with the advanced, on-board jog & teach routine or directly imported from a DXF, PLT or G-Code file.

Either way the path is easily edited in the optional Windows Software Suite's graphical display. These systems redefine the term "user friendly".
