

Filling Engravings on Fire Arms

A fire arms manufacturer needed to streamline filling laser engraved images with premixed 2-part epoxy paints.

Manual operator syringe filling proved too messy, time consuming and inconsistent.

The RP-1215 benchtop machine was chosen for the following reasons:

- Large stable base for easy fixturing
- Built in real time syringe controller
- Brushless servo motor performance
- Latest embedded control technology
- Product remains stationary
- On board "Jog & Teach" function
- Camera for teaching patterns
- Direct CAD import of motion paths
