

### Precision Filling - Automotive Badges

A leading manufacturer of cast nameplates required a solution that was not only accurate and repeatable, but dependable for 24-7 operation.

The RP-1215 benchtop machine was chosen for the following reasons:

- Pre loaded leadscrews and ball slides in each axis result in machine tool like performance.
- The embedded system includes an on-board digital syringe controller with provisions to control pressure pots, tanks and cartridges.
- No external controller or PC is required for operation.

The fill paths may be taught on the machine with the advanced "jog & teach" function or imported directly from a cad or graphic (vector) file.
